

Introducing the EasyFlow Gravitational Tap, a simple to operate, water saving alternative to the existing communal water tap. The EasyFlow Gravitational Tap was created with the sole mission to address the water wastage observed in many communities.

Advantages:

EasyFlow is a long-term investment for infrastructure as it requires no routine maintenance and it is designed to withstand prolonged exposure to the elements, as seen in multiple field tests.

- The mild steel body is chrome plated to prevent premature degradation.
- The elbow is galvanized to mitigate the effects of corrosion for more than 60 years.

EASYFLOW

EVERY DROP COUNTS

Easy Operation:

- Grip and lift the chrome plated mild steel body of the tap, thus, lifting the sealing washer off the seat.
- This action will allow the water to travel through the brass valve shaft and exit out of the body.
- Upon release, the weight of the body slides the frame down. Internally the sealing washer returns to its resting position on the seat washer, shutting off the water supply.
- This instantaneous reflex motion allows for zero water loss.
